MISCELLANEOUS: BACITRACIN IS A MIXTURE OF AT LEAST TEN CYCLIC
DODECAPEPTIDES, THAT DIFFER BY ONE OR TWO AMINO ACIDS. THE MOST
ABUNDANT IS BACITRACIN A, A BRANCHED CYCLIC DODECAPEPTIDE. IT
CONTAINS AN N-TERMINAL LINEAR PENTAPEPTIDE MOIETY (ILE-CYS-LEU-D-
GLU-LLE) WITH AN ISOLEUCINE-CYSTEINE THIAZOLLNE CONDENATION
PRODUCT AND A C-TERMINAL HEPTAPEPTIDE RING (LYS-D-ORN-ILE-D-PHE-
HIS-D-ASP-ASN), IN WHICH THE FREE ALPHA-CARBOXY GROUP OF THE C-
TERMINAL ASN IS BOUND TO THE EPSILON-AMINO GROUP OF TYSINE. IT
CONTAINS FOUR AMINO ACIDS IN THE D-CONFIGURATION (GLU-4, ORN-7, PHE-9, AND ASP-11).

-I- SIMILARITY: TO OTHER ENZYMES WHICH ACT VIA AN ATP-DEPENDENT
COVALENT BINDING OF AMP TO THEIR SUBSTRATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacillus licheniformis.

The sequence encodes Human UDP-N-acetyl-glucosamine:Galactose-betal, CC 3-N-acetylgalactosamine-alpha-R betal-6 N-acetylglucosaminyltransferase CC (UDP-GLONAC: Galbetal,3GalNAC alpha-R betal,6GlCNAC transferase or CC 273073). C23073 and nucleic acids encoding it are useful in the CC particularly a thymus-related disorder. C23073, nucleic acids encoding it are useful in the CC particularly a thymus-related disorder. C23073, nucleic acids encoding it and antibodies against it may also be used for in vitro CC encoding it and antibodies against it may also be used for in vitro CC encoding it and intibodies against it may also be used for in vitro CC exectors, in the prognostic and diagnostic evaluation of conditions CC associated with altered expression or activity of C23073 or conditions CC associated with altered expression or activity of C23073 or conditions CC experision and localising the DNA and protein, Disorders such as tumours CC (e.g. malignant melanoma, adenoma and sarcoma) and cancers (e.g. of the breast or cervix), hypoactivity, hyperactivity, atrophy, enlargement of CC breast or cervix), hypoactivity, leukamia, lymphomas, immunosuppression, CC acquired immunodeficiency syndrome (AIDS), Wiskott-Aldrich syndrome, CC sepsis, wound healing, acute and chronic infection, cell-mediated or chumour immunity, or THJ/TH2 imbalance, may be treated using these protein CC or nucleic acid. The antibodies may be used to screen potential CC therapeutic compounds to determine their effects on a conditions such as thymps-related disorder or cancer, to determine the level of C26073 or to detect and quantify polypeptides in a sample to determine their role in a particular cellular events or pathological states and to diagnose and CC creat such pathological states and to diagnose and

                                                                                                                                                                                                                                         The polypeptide can be used to treat diseases and disorders, such as cancer, cardiovascular disorders and inflammatory disorders including asthma, rheumatoid arthritis, inflammatory bowel disease, arteriosclerosis, septic shock, adult respiratory distress syndrome (ARDS) and cancer. Various platelet-mediated pathologies such as athersclerosis and clotting can also be treated. The plypeptides of the invention are predominantly expressed in pastrointestinal tissue (stomach, colon, intestine, testis) and are elevated in cancer. Castrointestinal disorders that may be prevented or treated include ascites, cholelithiasels, cirrhosis, Crohn's disease, diverticulitis and ulcerative colitis. The antibodies may be used in immuno-histochemical analysis, to detect the novel polypeptide and to localize it to particular cells and tissues and to specific subcellular clocalize it to particular cells and tissues and to specific subcellular cocations and to quantitate the level of expression.
                                                                                                                                                Query Match

Deta-1,6-N-acety1qlycosaminyltransferase (core2b GlcNAc-T) polypeptide. The polypeptide can be used to treat diseases and disorders such as cancer, cardiovascular disorders and inflammatory disorders including asthma, rheumatoid arrhritis, inflammatory bowel disease, arteriosclerosis, septic shock, adult respiratory distress syndrome (ARDS) and cancer. Various platelet-mediated pathologies such as athersclerosis and clotting can also be treated. The polypeptides of the invention are predominantly expressed in gastrointestinal tissue (stomach, colon, intestine, testis) and are elevated in cancer. Gastrointestinal disorders that may be prevented or treated include ascites, chielelithiasels, cirrhosis, Crohn's disease, diverticulitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

                                                                                                                                                                                                                                                                                                                                                   ascites, cholelithiaseis, cirrhosis, Crohn's disease, diverticulity and ulcerative colitis. The antibodies may be used in immuno-histochemical analysis, to detect the novel polypeptide and localize it to particular cells and tissues and to specific subcell locations and to quantitate the level of expression.

                                                                                                                                                                                                                                  1030
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell lines. C2GnT-M polypeptides may be used to prepare molecules have highly branched sialyl Lex and L-selectins, which may be subsequently used to modulate immune reactions, e.g. inflammation and tissue rejection, and to prevent or inhibit tumour metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 2128

AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be u

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc in gene therapy. The polynucleotide and proteins can be used for corporating, treating, or ameliorating a medical condition or in assays cc for diagnosing a pathological condition or a susceptibility to one in a cc subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Cc Agonists and antagonists to the antigens can be screened for The cc pancreatic cancer antigen polynucleotides can be used to design nucleic card hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic cand diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapettic methods. The proteins can be used to treat or prevent neural, immune system, muscular, creproductive, gastrointestinal, pulmonary, cardiovascular, renal or proteins used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1199
                       The present sequence encodes human UDP-N-acetylglucosamine:
N-acetylgalactosamine beta-1,6-N-acetylglucosaminyltransferase
(C2/4GnT). The protein is the third member of the family of O-glycan
beta-1,6-N-acetylglucosaminyltransferases. It adds core 2 or core 4
                                                                                                                                                                                           New nucleic acid molecule encoding UDP-N-acetylglucosamine useful probe for the detection of specified glucoseaminyltransferase from other species and related organisms \cdot

C2/4GnT can therefore be used in the production of appropriately glycosylated glycoconjugates with particular enzymatic, immunogenic, or other biological or physical properties. The nucleotide sequence is useful as a probe for the detection of C2/4GnT from other species and related organisms and for the recombinant production of C2/4GnT polypeptide. The nucleotide sequence was identified by analysis of EST database sequence information. Oligonucleotides derived from EST clone 17865 of ATCC were used to isolate two full-length C2/4GnT clones from a human foreskin genomic P1 library by 5' RACE PCR. RT-PCR was performed using C001205 human cell line mRNA in order to produce cDNA for expression of C2/4GnT in Sf9. The control of O-glycan core assembly has been implicated in tumour progression and metastasis.

                    reverse-transcribed and inserted into expression vector pcDNAL Plasmid DNA was used to transfect CHO-Py-leu cells. Transfected cells were screened using human anti-I antigen antibodies and god anti-human IgM. Plasmid DNA was analyzed to obtain DNA (given in AAQ89201) encoding I-branching enzyme (AAR71932).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1754

δÃ A cDNA insert (AAT16201) in pcDNAI-IGhT codes for human beta-1,6-N-acetylglucosaminyltransferase, I-branching enzyme (IGhT) (AAR92474), an enzyme that converts blood group i antigen to I antigen. The cDNA was isolated from a cDNA library pred. from human PA-1 teratocarcinoma cells in vector pcDNAI following transfection into CHO-Py-leu cells and screening with human anti-I antibodies. The cDNA can be used to regulate the expression of human IGhT or to modify its biological function, to produce soluble or membrane-bound forms of IGhT in host cells, to breed transgenic animals, and to design anticenses. Human beta-1,6-N-acetyl:glucosaminyl transferase, used to develop prods. for the study, detection pathological conditions involving the enzyme. beta-1,6-N-acetylglucosaminyltransferase, the I-branching enzyme (IGnT). The protein sequence has a type II transmembrane topology that consists of a short amino terminal cytoplasmic sequence, a signal-anchor sequence followed by a short stem region and a large carboxyl terminal catalytic domain. The protein shows some homology to core 2-beta-1, N-acetylglucosaminyltransferase (2GnT). The nucleic acid sequence is used for producing IGnT polypeptides, which can be used to treat disorders arising from under expression of IGnT, e.g. increased susceptibility to type-II hypersensitivity reactions such as neonatal haemolytic disease, autoimmune haemolytic anaemia and thrombocytopenia.
                                                                                                                                                                                                                                                                                                  Claim 2; Columns 29-32; 31pp; English.
                                                                                                                                                                                                                                                                                                                                         New nucleic acid sequences and their complementary sequences - useful for producing fragment of recombinant human I-branching -1,6-N-acety1-glucosaminy1-transferase polypeptide

```

```
This cDNA encodes a human beta-1,6-N-acetylglucosaminyltransferase, I r-branching enzyme (IGnT). This nucleic acid encodes both the soluble and membrane-bound IGnT. This nucleic acid encodes both the soluble specifically reactive with IGnT or an active fragment comprising a catalytic domain of IGnT. These anti-IGnT antibodies can be used to detect IGnT or IGnT-expressing cells in biological samples, e.g. to human cDNA expression libraries, to purify IGnT from compositions containing it, or to image IGnT-containing sites in vivo as IGnT is involved in tumour cell adhesion to endothellum and leuxocyte adhesion to inflammatory sites.
                                                                                adhesion

                                                                                                                                                                                                                                                                                                        The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

critical branches in O-glycans. cDNAs encoding various glycosyltransferases can be isolated by transfert expression of in recipient cells, e.g. COS-1. COS-1 cells were transfected with a cDNA library, pcDSR alpha-2F1, constructed from poly(A)+ of activated T lymphocytes which express the CZGNT. Transfected cells were selected using MAb T305, which identifies a hexasaccharide on leukosialin. Leukosialin CD43 is an acceptor molecule for CZGNT activity. A plasmid, pcDSR alpha-Leu, which directed expression of the T305 antigen was identified. The CDNA insert was isolated and sequenced. The cDNA encoded the acceptor molecule leukosialin CD43.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1070
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4
                                                                                         밁
                                                                                                                               This invention describes a method for screening for a substance that CC may be used to prevent or treat cardiomyopathy associated with diabetes. CC and hyperglycaemia. This method involves reacting core 2 GlCNAc-TC (UDP-GlCNAc:Galbetal-3GalNAc-alphar beta-1,6-N-acetylglucosaminyl-CC transferase) with an acceptor substrate and a sugar nucleotide donor in CC transferase) with an acceptor substrate and a sugar nucleotide donor in CC product, and comparing the amount of reaction product with the amount of product, and comparing the amount of reaction product with the amount CC product, and comparing the amount of reaction product with the amount CC reaction product in the presence of the test substance indicate that the CC substance inhibits core 2 GlCNAc-T. The invention also describes (1) CC methods for preventing or treating cardiomyopathy associated with CC diabetes and hyperglycaemia, and (2) transgenic nonhuman animal whose CC germ cells and somatic cells all contain a DNA construct introduced into the animal or an ancestor of the animal at an embryonic stage, where construct animal to develop cardiomyopathy associated with diabetes mellitus and hyperglycaemia. This sequence encodes the rat CC child bettes mellitus and hyperglycaemia. This sequence encodes the rat CC child protein which is used to describe the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAX24042

The enzyme is associated with cardiomyopathy in diabetes and hyperglycaemia sufferers. The invention also provides methods for identifying inhibitors of core 2 GlcNAc-T which can be used
